## The category algebra.

Work in some perfect Polish space, e.g. ${ }^{\omega} 2$.
$\mathcal{B}$ is the collection of all sets with the property of Baire,
MGR is the ideal of meager sets,

$$
\mathcal{B} / \mathrm{MGR} \cong \mathrm{BOR} / \mathrm{MGR}=\mathrm{CAT}
$$

Cat is unique up-to isomorphism, i.e. it does not depend on the Polish space. The map

$$
\rho: \mathrm{CAT} \rightarrow \mathrm{RO}
$$

is a selector, and Cat can be identified with the collection of all regular open sets.
Cat is a Polish space.

## The measure algebra.

$\mu$ a continuous probability Borel measure on some perfect Polish space, e.g. the usual Lebesgue measure on ${ }^{\omega} 2$.
Meas is the collection of all sets measurable sets, NuLL is the ideal of measure-zero sets,

$$
\mathrm{MEAS} / \mathrm{NULL} \cong \mathrm{BOR} / \mathrm{NULL}=\mathrm{MALG}
$$

MALG is unique up-to isomorphism, i.e. it does not depend on $\mu$. MALG is a Polish space:

$$
\delta([A],[B])=\mu(A \triangle B)
$$

## Definition

$x$ has density $r \in[0 ; 1]$ in $A$ if

$$
d_{A}(x) \stackrel{\text { def }}{=} \lim _{n \rightarrow \infty} \frac{\mu\left(A \cap \boldsymbol{N}_{x \mid n}\right)}{\mu\left(\boldsymbol{N}_{x \mid n}\right)}=r .
$$

Theorem (Lebesgue)
Let $A \subseteq{ }^{\omega} 2$ be Lebesgue measurable. Then

$$
\Phi(A)=\left\{x \in{ }^{\omega} 2 \mid x \text { has density } 1 \text { in } A\right\}
$$

is Lebesgue measurable, and $\mu(A \triangle \Phi(A))=0$.
In other words: $d_{A}$ agrees with $\chi_{A}$ almost everywhere.

If $\mu(A \triangle B)=0$ then $\Phi(A)=\Phi(B)$, so

$$
\Phi: \text { MALG } \rightarrow \text { MEAS }
$$

is a selector. This is the analogue of $\rho: \mathrm{CAT} \rightarrow \mathrm{RO}$.

## Question

What is the complexity of $\Phi(A)$ ?

## Definition

The localization of $A$ at $s$ is

$$
A_{\lfloor s\rfloor}=\left\{x \in{ }^{\omega} 2 \mid s^{\wedge} x \in A\right\}
$$

Thus $s^{\wedge} A_{\lfloor s\rfloor}=A \cap \boldsymbol{N}_{s}$.

## Trivial observation

$$
\mu(A \triangle B)=0 \Leftrightarrow \forall s \in^{<\omega} 2\left(\mu\left(A_{\lfloor s\rfloor}\right)=\mu\left(B_{\lfloor s\rfloor}\right)\right)
$$

Thus a measure class $[A]$ is completely determined by the map $s \mapsto \mu\left(A_{\lfloor s\rfloor}\right)$

## Since

$$
x \in \Phi(A) \Leftrightarrow \forall k \exists n \forall m \geq n\left(\mu\left(A_{\lfloor x \mid m\rfloor}\right) \geq 1-2^{-k-1}\right)
$$

then
Proposition (Folklore)
For all measurable $A$

$$
\Phi(A) \in \Pi_{3}^{0} .
$$

## Question

 Is $\Pi_{3}^{0}$ optimal?- $A \subseteq B \Rightarrow \Phi(A) \subseteq \Phi(B)$,
- $\Phi(A \cap B)=\Phi(A) \cap \Phi(B)$,
- $\bigcup_{i \in I} \Phi\left(A_{i}\right) \subseteq \Phi\left(\bigcup_{i \in I} A_{i}\right)$,
- if $A$ is open, then $A \subseteq \Phi(A)$.

## Definition

$$
\mathcal{T}=\{A \in \operatorname{MEAS} \mid A \subseteq \Phi(A)\}
$$

is the density topology. It is finer than the usual topology.

# Theorem (Scheinberg 1971, Oxtoby 1971?) 

$A=\Phi(A)$ if and only if $A$ is open and regular in $\mathcal{T}$.

$$
\Phi: \text { MALG } \rightarrow \mathrm{RO}_{\mathcal{T}}
$$

- $\operatorname{NuLL}=\operatorname{MGR}_{\mathcal{T}}$ (Oxtoby, 1971)
- $\mathcal{T}$ is neither first countable, nor second countable, nor Lindelöf, nor separable.
- $\mathcal{T}$ is Baire.

Recall that $\Phi(A)$ is always $\Pi_{3}^{0}$.
Theorem
There is a closed $C$ such that $\Phi(C)$ is complete $\Pi_{3}^{0}$
Clearly

$$
\operatorname{lnt}(A) \subseteq \Phi(A) \subseteq \mathrm{Cl}(A) .
$$

and $A=\Phi(A)$ if $A$ is clopen.

## Question

Can $\Phi(A)$ be something other than clopen or complete $\Pi_{3}^{0}$ ?

## Yes!

## Definition

$A$ is Wadge reducible to $B$

$$
A \leq_{\mathrm{w}} B
$$

just in case $A=f^{-1}(B)$ for some continuous $f:{ }^{\omega} 2 \rightarrow{ }^{\omega} 2$.
$A \equiv{ }_{\mathrm{w}} B$ iff $A \leq_{\mathrm{w}} B \wedge B \leq_{\mathrm{w}} A$.
The equivalence classes $[A]_{\mathrm{W}}$ are called Wadge degrees.

## Theorem

$\forall A \in \Pi_{3}^{0} \exists C \in \Pi_{1}^{0}\left(\Phi(C) \equiv{ }_{\mathrm{w}} A\right)$

Recall that $d_{A}(x)=0,1$ for almost all $x$.

## Definition

A set $A$ is dualistic (or Manichæan) if $d_{A}(x)=0,1$ for all $x$. $\mathcal{M}$ is the Boolean algebra of all dualistic sets.

Clearly being dualistic depends on the equivalence class of $A$, so

$$
A \in \mathcal{M} \Leftrightarrow \Phi(A) \in \mathcal{M}
$$

## Fact

$A=\Phi(A)$ is dualistic iff $A$ is $\mathcal{T}$-clopen, i.e.,

$$
\mathcal{M} \cap \operatorname{ran}(\Phi)=\Delta_{1}^{0}-\mathcal{T}
$$

## Proposition

$\forall A \in \operatorname{Meas}\left(A \in \mathcal{M} \Rightarrow \Phi(A) \in \Delta_{2}^{0}\right)$.
Theorem
$\forall A \in \Delta_{2}^{0} \exists C \in \Pi_{1}^{0}\left(\Phi(C) \equiv_{\mathrm{w}} A \wedge \Phi(C) \in \mathcal{M}\right)$.

## Proposition

$\Phi$ is Borel (as a map from Malg to the set of codes for $\Pi_{3}^{0}$ sets).

## Sketch of the proof for $\Pi_{3}^{0}$ completeness

- $T$ a pruned tree such that [ $T$ ] has positive measure and empty interior. Thus $\neg[T]=\bigcup_{n} \boldsymbol{N}_{t_{n}}$.
- $n<m \Rightarrow \operatorname{lh}\left(t_{n}\right)<\operatorname{lh}\left(t_{m}\right)$ and $\exists^{\infty} n\left(\operatorname{lh}\left(t_{n}\right)+1<\operatorname{lh}\left(t_{n+1}\right)\right)$.
- For all $t \in T$ there is a shortest $s \supset t$ such that $s \notin T$. $s$ is the target of $t$.
- Let $\tau(t)=\operatorname{lh}($ target of $t)-\operatorname{lh}(t), \tau: T \rightarrow \omega \backslash\{0\}$.
- For $x \in[T]$,

$$
x \in \Phi([T]) \Leftrightarrow \lim _{n \rightarrow \infty} \tau(x \upharpoonright n)=\infty .
$$

## Sketch of the proof for $\Pi_{3}^{0}$ completeness, ctd.

The set

$$
P=\left\{z \in{ }^{\omega \times \omega} 2 \mid \forall m \forall^{\infty} n z(n, m)=0\right\} .
$$

is complete $\Pi_{3}^{0}$.
Given a: $n \times n \rightarrow 2$ construct a node $\varphi(a) \in T$ so that

$$
a \subset b \Rightarrow \varphi(a) \subset \varphi(b)
$$

and

$$
\omega \times \omega 2 \rightarrow[T], \quad z \mapsto \bigcup_{n} \varphi(z \upharpoonright n \times n)
$$

witnesses $P \leq_{W} \Phi([T])$.

Sketch of the proof for $\Pi_{3}^{0}$ completeness, ctd.
Let $a:(n+1) \times(n+1) \rightarrow 2$. (Say $n=4)$
Case 1:

| $a_{0,4}$ | $a_{1,4}$ | $a_{2,4}$ | $a_{3,4}$ | 0 |
| :--- | :--- | :--- | :--- | :--- |
| $a_{0,3}$ | $a_{1,3}$ | $a_{2,3}$ | $a_{3,3}$ | 0 |
| $a_{0,2}$ | $a_{1,2}$ | $a_{2,2}$ | $a_{3,2}$ | 0 |
| $a_{0,1}$ | $a_{1,1}$ | $a_{2,1}$ | $a_{3,1}$ | 0 |
| $a_{0,0}$ | $a_{1,0}$ | $a_{2,0}$ | $a_{3,0}$ | 0 |

Then pick $t \supset \varphi(a \upharpoonright n \times n)$ such that

$$
\tau(t) \geq \max \{n+1, \tau(\varphi(a \upharpoonright n \times n))\}
$$

Sketch of the proof for $\Pi_{3}^{0}$ completeness, ctd.
Let $a:(n+1) \times(n+1) \rightarrow 2$. (Say $n=4)$
Case 2:

| $a_{0,4}$ | $a_{1,4}$ | $a_{2,4}$ | $a_{3,4}$ | $a_{4,4}$ |
| :---: | :---: | :---: | :---: | :---: |
| $a_{0,3}$ | $a_{1,3}$ | $a_{2,3}$ | $a_{3,3}$ | $a_{4,3}$ |
| $a_{0,2}$ | $a_{1,2}$ | $a_{2,2}$ | $a_{3,2}$ | $a_{4,2}$ |
| $a_{0,1}$ | $a_{1,1}$ | $a_{2,1}$ | $a_{3,1}$ | 0 |
| $a_{0,0}$ | $a_{1,0}$ | $a_{2,0}$ | $a_{3,0}$ | 0 |

Then pick $t \supset \varphi(a \upharpoonright n \times n)$ such that

$$
\tau(t)=3
$$

## The Wadge hierarchy on ${ }^{\omega} 2$.

- A set $A$ (or degree) is self dual if $A \equiv_{\mathrm{w}} \neg A$. Otherwise it is non-self-dual.
- Self-dual and non-self-dual pairs alternate.
- At all limit levels there is a non-self-dual pair.

How to construct larger degrees.
Given $f: \omega \rightarrow \omega \backslash\{0\}$ and sets $A_{0}, A_{1}, \ldots$ consider the set

## How to construct larger degrees.

If $\exists^{\infty} n(f(n) \geq 2)$ and the $A_{n} s$ are $\mathcal{T}$-regular, i.e. $\Phi\left(A_{n}\right)=A_{n}$ then so is Rake ${ }^{-}\left(f ;\left(A_{n}\right)_{n}\right)$. Moreover

- if $A=A_{0}=A_{1}=\ldots$ are self-dual, then $\operatorname{Rake}^{-}\left(f ;\left(A_{n}\right)_{n}\right)$ is non-self-dual and immediately above $A$,
- if $A_{0}<\mathrm{w} A_{1}<\mathrm{w} A_{2}<\mathrm{w} \ldots$ then Rake $^{-}\left(f ;\left(A_{n}\right)_{n}\right)$ is non-self-dual and immediately above the $A_{n}$ s.
Note that the rake $\operatorname{Rake}^{-}\left(f ;\left(A_{n}\right)_{n}\right)$ has no pole, i.e., $0^{(\infty)}$ does not belong to this set. In order to construct the dual degrees we need another kind of rake, a pole and densely packed tines.

## How to construct larger degrees.

## How to construct larger degrees.

If $\lim _{n} f(n)=\infty$ then and the $A_{n}$ s are $\mathcal{T}$-regular, i.e. $\Phi\left(A_{n}\right)=A_{n}$ then so is Rake ${ }^{+}\left(f ;\left(A_{n}\right)_{n}\right)$. Moreover

$$
\operatorname{Rake}^{+}\left(f ;\left(A_{n}\right)_{n}\right) \equiv_{\mathrm{W}} \neg \operatorname{Rake}^{-}\left(f ;\left(A_{n}\right)_{n}\right)
$$

If $A$ and $B$ are $\mathcal{T}$-regular then so is

$$
A \oplus B=0^{\wedge} A \cup 1^{\wedge} B
$$

Arguing this way, we can climb up to $\Delta_{2}^{0}$.

## Jumping $\omega_{1}$ levels.

Wadge defined two operations $A^{\natural}$ and $A^{b}$ on subsets of the Baire space

$$
\begin{aligned}
& A^{\natural}=\left\{s_{0}^{+} 0^{\wedge} s_{1}^{+} 0^{\wedge} \ldots \wedge_{n}^{+} 0^{\wedge} x^{+} \mid n \in \omega, s_{i} \in{ }^{<\omega} \omega, x \in A\right\} \\
& A^{b}=A^{\natural} \cup\left\{x \in{ }^{\omega} \omega \mid \exists^{\infty} n(x(n)=0)\right\}
\end{aligned}
$$

where $s^{+}$and $x^{+}$are the sequences obtained from $s$ and $x$ by adding a 1 to all entries.
The idea is that $A^{\natural}$ is the union of $\omega$ many layers of the form

$$
A^{+}=\left\{x^{+} \mid x \in A\right\}
$$

$A^{+}$

## Jumping $\omega_{1}$ levels.

## Theorem (Wadge)

If $A$ is self-dual, then $A^{\natural}$ and $A^{b}$ form a non-self-dual pair and

$$
\left\|\boldsymbol{A}^{\natural}\right\|_{\mathrm{W}}=\left\|\boldsymbol{A}^{\mathfrak{b}}\right\|_{\mathrm{W}}=\|\boldsymbol{A}\|_{\mathrm{W}} \cdot \omega_{1} .
$$

The operations $A^{\natural}$ and $A^{b}$ together with the (analogs of) the Rake operations, are sufficient to construct sets of rank $<\omega_{1}^{\omega_{1}}$, i.e. the $\Delta_{3}^{0}$ sets.

## Jumping $\omega_{1}$ levels.

An analogue of $A^{+}$.

- $\overline{s^{\wedge i}}=\bar{s}^{\wedge} i i$, for $s \in{ }^{<\omega} 2$.
- $\bar{x}=\bigcup_{n} \overline{x\lceil n}$, for $x \in{ }^{\omega} 2$.
- Replace $A$ with $\{\bar{x} \mid x \in A\}$, but. . .
- Does not work, since $\left\{\bar{x} \mid x \in{ }^{\omega} 2\right\}$ is of measure 0 !
- The cure: enlarge $\{\bar{x} \mid x \in A\}$ like Rake ${ }^{-}$was enlarged to Rake ${ }^{+}$. The resulting set is called $\operatorname{Plus}(A)$.
- In fact we construct $\operatorname{Plus}(A ; r)$ (with $r \in(0 ; 1))$ so that $\mu\left(\operatorname{Plus}(A ; r)_{\lfloor\bar{s}\rfloor}\right) \geq r$ for all $s$.
- If $A$ is $\mathcal{T}$-regular (i.e., $A=\Phi(A)$ ), then so is $\operatorname{Plus}(A ; r)$.

## Jumping $\omega_{1}$ levels.

Construct $\operatorname{Nat}(A)$ and $\operatorname{Flat}(A)$ : they are the analogs of $A^{\natural}$ and $A^{\natural}$, and have rank $\|A\|_{\mathrm{w}} \cdot \omega_{1}$.
Using the operations $\operatorname{Nat}(A), \operatorname{Flat}(A)$, Rake $^{-} A$, Rake $^{+} A$, and $\oplus$ it is possible to construct a closed sets $C$ such that $\Phi(C)$ is of any given Wadge degree in $\Delta_{3}^{0}$.

## $\operatorname{Nat}(A)$

Fix $0<r<1 . \operatorname{Nat}(A)$ is composed of $\omega$-many layers

## Plus $(A ; r)$

Plus $(A ; r)$

## Plus $(A ; r)$

- If $x$ settles inside a layer, then $x=s^{\wedge} \bar{y}$ and the density of $x$ in $\operatorname{Nat}(A)$ will be 'similar' to the density of $y$ in $A$.
- Every time we climb to a higher level, the density drops momentarily to $\leq 1 / 2$. So if $x$ climbs infinitely many layers, then $x$ will not have density 1 in $\operatorname{Nat}(A)$.

## $\operatorname{Flat}(A)$

Fix $0<r_{0}<r_{1}<r_{2}<\cdots \rightarrow 1$.
Flat $(A)$ is the set is composed of $\omega$-many layers

## Plus $\left(A ; r_{2}\right)$ <br> $\operatorname{Plus}\left(A ; r_{1}\right)$

## Plus $\left(A ; r_{0}\right)$

- If $x$ settles inside a layer, then $x=s^{\wedge} \bar{y}$ and the density of $x$ in Flat $(A)$ will be 'similar' to the density of $y$ in $A$.
- In the layer $n$, the density will always be $\geq r_{n}$. So if $x$ climbs infinitely many layers, then $x$ will have density 1 in $\operatorname{Flat}(A)$.
