Natasha Dobrinen and Sy used a generalization of Sacks forcing to reduce the large cardinal strength required to obtain the tree property at the double successor of a measurable cardinal κ from a supercompact to a weakly compact hypermeasurable cardinal. In their model $2^\kappa = \kappa^{++}$.

On the other hand, $\text{TP}(\aleph_2)$ is consistent with large continuum (a detailed proof was given by Spencer Unger). So, the idea was to prove the analogous result for $\text{TP}(\kappa^{++})$ with κ measurable, using Mitchell’s forcing together with a “surgery” argument.

Natasha Dobrinen and Sy used a generalization of Sacks forcing to reduce the large cardinal strength required to obtain the tree property at the double successor of a measurable cardinal κ from a supercompact to a weakly compact hypermeasurable cardinal. In their model $2^\kappa = \kappa^{++}$.

On the other hand, $\text{TP}(\aleph_2)$ is consistent with large continuum (a detailed proof was given by Spencer Unger). So, the idea was to prove the analogous result for $\text{TP}(\kappa^{++})$ with κ measurable, using Mitchell’s forcing together with a “surgery” argument.

As in Dobrinen–Friedman paper, the consistency of a cardinal κ of Mitchell order λ^+ , where λ is weakly compact and greater than κ , is a lower bound on the consistency strength of $\text{TP}(\kappa^{++})$ with κ measurable and $2^\kappa = \kappa^{+++}$. Therefore our result is in fact almost an equiconsistency result.

Since $M(\kappa, \lambda)$ is known to preserve the tree property at λ while making λ into the κ^{++} of the extension, the idea is simply to force with $Add(\kappa, \lambda^+)$ over $V^{M(\kappa, \lambda)}$. However, in order to preserve the measurability of κ , our intended model will be a little different:

Theorem

Motivation

The proof

The end

Lemma

R is κ^+ -closed and λ -Knaster in $V[G][g_0]$.

Proof.

The closure follows easily because R is κ^+ -closed in $M_0[G][g_0][H_0]$ and $M_0[G][g_0][H_0]$ is closed under κ -sequences in $V[G][g_0]$. Let $\langle p_\alpha : \alpha < \lambda \rangle$ be a sequence of conditions in R , and let p_α be of the form $j_0(f_\alpha)(\kappa)$ for some function $f_\alpha : \kappa \rightarrow \text{Add}(\kappa, \lambda^+)$, $f_\alpha \in V[G]$. A Δ -system argument shows that λ many of the functions f_α are pointwise compatible. It follows that λ many of the conditions p_α are compatible. \square

Theorem

Motivation

The proof

The end

Lemma

*The forcing $Q \times R$ is κ^+ -distributive in $V^{P_\kappa * Add(\kappa, \lambda^+)}$.*

Proof.

The forcings Q', R are closed in the model $V^{P_\kappa * Add(\kappa, (\lambda_0^+)^{M_0})}$ in which they are defined, therefore their product $Q' \times R$ is closed in there as well. By Easton's lemma, after forcing with the κ^+ -c.c. forcing $Add(\kappa, [(\lambda_0^+)^{M_0}, \lambda^+))$, the product $Q' \times R$ will remain κ^+ -distributive. Since κ^+ -distributivity is equivalent to not adding new κ -sequences of ordinals, it follows from the above facts about projections that $Q \times R$ is distributive in $V^{P_\kappa * Add(\kappa, \lambda^+)}$ as well. \square

The proof

The end

In the general case where κ is θ -hypermeasurable we can first force to add a function $f : \kappa \rightarrow \kappa$ with $j(f)(\kappa) = \theta$. Then θ_0 , M_0 's version of θ , is less than κ^{++} , because $\theta_0 = j_0(f)(\kappa) < j_0(\kappa) < \kappa^{++}$. It follows that the forcing R still has the λ -Knaster property in $V^{P_\kappa * \text{Add}(\kappa, \theta_0)}$, and hence, the above lemmas apply in the general case.

Let g be an $Add(\kappa, [(\lambda_0^+)^{M_0}, \lambda^+))$ -generic filter over $V[G][g_0]$. We first use a ‘surgery’ argument to lift j to an embedding of $V[G][g_0][g]$.

The embedding j can be factored as $k \circ j_0$, where $k : M_0 \rightarrow M$ is defined by $k([F]_U) := j(F)(\kappa)$. The embedding k is also elementary and its critical point is $(\kappa^{++})^{M_0}$. By elementarity and GCH, $(\kappa^{++})^{M_0} < j_0(\kappa) < \kappa^{++}$. Note also that $k(\lambda_0) = \lambda$.

Note that $g_{|\lambda} * G_Q * h_{|\lambda}$ is also $Add(\kappa, \lambda) * Q \times R'$ -generic over N_0 .

Since $\text{crit}(k)=\lambda$, we can factor $k(Add(\kappa, \lambda) * Q \times R')$ as

$$Add(\kappa, \lambda) * Add(\kappa, [\lambda, k(\lambda)]) * Q * Q^* \times R' \times R^*$$

where Q^* and R^* denote the tail forcings $k(Q)/Q$ and $k(R')/R'$, respectively, with components indexed from the interval $[\lambda, k(\lambda))$.

where Q^* and R^* denote the tail forcings $k(Q)/Q$ and $k(R')/R'$, respectively, with components indexed from the interval $[\lambda, k(\lambda))$.

Since k is the identity on $g_{|\lambda} * G_Q * h_{|\lambda}$ we can extend the embedding $k : N_0 \rightarrow N_1$ in some large universe U to an embedding

$$k : N_0[g_{|\lambda}][G_Q][h_{|\lambda}] \rightarrow N_1[g_{|\lambda}][g^*][G_Q][G_Q^*][h_{|\lambda}][h^*]$$

where g^* , G_{Q^*} , h^* are arbitrary generics for $Add(\kappa, [\lambda, k(\lambda)))$, Q^* , R^* , respectively, picked in U .

Since $T \in N_0[g_{|\lambda}][G_Q][h_{|\lambda}]$ is a λ -Aronszajn tree, by elementarity $k(T)$ is a $k(\lambda)$ -Aronszajn tree in $N_1[g_{|\lambda}][g^*][G_Q][G_{Q^*}][h_{|\lambda}][h^*]$ which coincides with T up to level λ . Hence T has a cofinal branch b in $N_1[g_{|\lambda}][g^*][G_Q][G_{Q^*}][h_{|\lambda}][h^*]$. We will show that b must actually belong to $N_1[g_{|\lambda}][G_Q][h_{|\lambda}]$ (i.e. the tail generics g^* , G_{Q^*} , h^* can not add a new branch), and thereby reach the desired contradiction to the assumption that T has no cofinal branches in $V[G][g_0][g][G_Q][h]$!

Since $T \in N_0[g_{|\lambda}][G_Q][h_{|\lambda}]$ is a λ -Aronszajn tree, by elementarity $k(T)$ is a $k(\lambda)$ -Aronszajn tree in $N_1[g_{|\lambda}][g^*][G_Q][G_{Q^*}][h_{|\lambda}][h^*]$ which coincides with T up to level λ . Hence T has a cofinal branch b in $N_1[g_{|\lambda}][g^*][G_Q][G_{Q^*}][h_{|\lambda}][h^*]$. We will show that b must actually belong to $N_1[g_{|\lambda}][G_Q][h_{|\lambda}]$ (i.e. the tail generics g^* , G_{Q^*} , h^* can not add a new branch), and thereby reach the desired contradiction to the assumption that T has no cofinal branches in $V[G][g_0][g][G_Q][h]$!

Similarly as above, in N_1 there is a projection from the product

$$\text{Add}(\kappa, \lambda) \times \text{Add}(\kappa, [\lambda, k(\lambda)]) \times Q' \times Q^{*'} \times R' \times R^*$$

onto

$$\text{Add}(\kappa, \lambda) * \text{Add}(\kappa, [\lambda, k(\lambda)]) * Q * Q^* \times R' \times R^*,$$

where Q' , $Q^{*'}$ are κ^+ -closed forcings defined in N_1 . Let $G_{Q'} \times G_{Q^{*'}}$ be $Q' \times Q^{*'}$ -generic over $N_1[g_{|\lambda}][g^*]$.

$$N_1[G_{Q'}][h_{|\lambda}][g_{|\lambda}][g^*][G_{Q^{*'}}][h^*].$$

Note that in $N_1[G_{Q'}][h_{|\lambda}]$, $Q^{*' \times R^*$ is κ^+ -closed forcing and $Add(\kappa, k(\lambda))$ is κ^+ -c.c. Therefore, it can be shown that $Q^{*' \times R^*$ doesn't add any branches to T over the model $N_1[G_{Q'}][h_{|\lambda}][g_{|\lambda}][g^*]$. Finally, $Add(\kappa, [\lambda, k(\lambda)])$ has the κ^{++} -Knaster property, which means that it couldn't have added the branch b over the model $N_1[G_{Q'}][h_{|\lambda}][g_{|\lambda}]$ either. This proves $TP(\kappa^{++})$. \square
