Introduction	Infodump	Inside the machinery	Open questions		

Theorem (Kunen, 1971)

If $j: V \prec M$, then $M \neq V$.

Kunen's proof uses a choice function that is in $V_{\lambda+2}$.

Introduction	Infodump	Inside the machinery	Open questions

Theorem (Kunen, 1971)

If $j: V \prec M$, then $M \neq V$.

Kunen's proof uses a choice function that is in $V_{\lambda+2}$. So

Corollary

There is no $j: V_{\eta} \prec V_{\eta}$, with $\eta \ge \lambda + 2$.

```
I3 iff there exists \lambda s.t. \exists j : V_{\lambda} \prec V_{\lambda};
```

Where is Generic Absoluteness coming from?

I0 is very similar to $AD^{L(\mathbb{R})}$. Woodin defined $\mathbb{U}(j)$ -representable sets in a manner similar to homogeneusly Souslin sets.

I0 is very similar to $AD^{L(\mathbb{R})}$. Woodin defined $\mathbb{U}(j)$ -representable sets in a manner similar to homogeneusly Souslin sets.

All the subsets of $V_{\lambda+1}$ in $L(\mathbb{R})$ are $\mathbb{U}(j)$ -representable (Cramer), and the "simple" ones are uniformely $\mathbb{U}(j)$ -representable (they behave well w.r.t j) (Woodin)

An example: j and the theory of $V_{\lambda+1}$ are simple. therefore coded by some structure

Generic Absoluteness Theorem (extended)

Suppose there exists $j : L(V_{\lambda+1}) \prec L(V_{\lambda+1})$. Let (M_{ω}, j_{ω}) be the ω -th iterate of $(L(V_{\lambda+1}), j)$. Let $G \in V$ generic for M_{ω} such that $(cof(\lambda) = \omega)^{M_{\omega}[G]}$. Then there exists $\pi : (L_{\omega}(V_{\lambda+1}))^{M_{\omega}[G]} \prec L_{\omega}(V_{\lambda+1})$ with $\pi \upharpoonright V_{\lambda} = id$.

Therefore assuming $IO(j, \lambda, \kappa)$, if \mathbb{P} is a forcing notion that adds a cofinal ω -sequence to κ and such that $j_{0,\omega}(\mathbb{P})$ has a generic in V, then $I1(\kappa)$ holds in a generic extension of V.

16 / 17

What about I0 (or above)?

Is it possible to avoid generic absoluteness?

Thanks for your attention
